

HURST

SAFE LABEL REMOVAL FROM SYRINGES AND CARTRIDGES

HURST CORPORATION announces a new system for safely removing film type labels from small diameter glass syringes and cartridges. The Patent pending **HURST Model SLS** (Syringe Label Slitter) tangentially slits film type labels providing a lifted label edge and an opposing compressed label edge. The lifted edge provides purchase for the **HURST Model SLR** (Syringe Label Remover) to seize the labels lifted edge subsequently unwrapping the entire label. Both label and adhesive are removed as an integral unit.

The **SLS** machine manually creates a lifted label edge and an opposing compressed label edge.

The **SLR** machine's ultra sticky tape seizes the lifted label edge and sequentially unwraps the entire label.

SAFE FOR OPERATORS SAFE FOR PRODUCT

SLS Label Slitting Machines combine with **SLR** Label Removing Machines to produce a safe way to remove labels from syringes and cartridges. Hand held razors and picks are completely eliminated.

HURST SLS and SLR machines can accommodate a wide range of syringe sizes and configurations up to 6" in overall length and up to 1" in diameter. HURST label removal tapes are available from ½" to 3" in width. Installation and training are available worldwide.
